READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name on all the work you hand in.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams, graphs or rough working.
Do not use staples, paper clips, glue or correction fluid.
DO NOT WRITE IN ANY BARCODES.

Answer all questions.
Electronic calculators may be used.
You may lose marks if you do not show your working or if you do not use appropriate units.
A copy of the Periodic Table is printed on page 28.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.
Some information about a food chain is listed.

Caterpillars are herbivores.
Blackbirds eat caterpillars.
Hawks are carnivores.
Cabbages carry out photosynthesis.

(a) Complete the food chain in Fig. 1.1, using the information in the sentences.

Do not draw pictures of the organisms.

(b) The hawk in this food chain dies.

State the name of the type of organism that obtains its energy from the body of the dead hawk.

.............................................................................................................................................  [1]

(c) State the source of energy for the food chain.

.............................................................................................................................................  [1]

[Total: 5]
2 A ball rests on a track, as shown in Fig. 2.1.

![Fig. 2.1](image_url)

The track is tilted and the ball accelerates as it rolls down the track.

(a) State what is meant by *acceleration*.

...................................................................................................................................................
...................................................................................................................................................
................................................................................................................................................... [2]

(b) Fig. 2.2 shows how the speed of the ball varies as it rolls down the track.

![Fig. 2.2](image_url)

(i) On Fig. 2.2, draw the curved line of best fit. [1]
(ii) Use Fig. 2.2 to complete Table 2.1. [1]

<table>
<thead>
<tr>
<th>time / s</th>
<th>0</th>
<th>0.5</th>
<th>1.0</th>
<th>1.5</th>
<th>2.0</th>
<th>2.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>speed cm/s</td>
<td>0</td>
<td>3.0</td>
<td>5.0</td>
<td>6.8</td>
<td>........</td>
<td>8.2</td>
</tr>
</tbody>
</table>

(iii) Describe how the acceleration of the ball changes as it rolls down the track.

.........................................................................................................................................................................................................................................................
......................................................................................................................................................................................................................................................... [1]

[Total: 5]
Nitrogen dioxide and carbon monoxide are produced in car engines. They cause pollution of the atmosphere.

When universal indicator is added to an aqueous solution of nitrogen dioxide, the indicator turns red.

(a) (i) Suggest the pH of the nitrogen dioxide solution. .......................................................... [1]

(ii) State one effect that nitrogen dioxide has on the environment.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
........................................................................................................................................... [1]

(b) Nitrogen dioxide and carbon monoxide are removed from the exhaust gases of modern cars using a catalytic converter. This changes nitrogen dioxide and carbon monoxide into nitrogen and carbon dioxide.

The equation for the reaction is

\[ 2\text{NO}_2 + 4\text{CO} \rightarrow \text{N}_2 + 4\text{CO}_2 \, . \]

[\text{A}_r: \text{O}, 16; \text{N}, 14; \text{C}, 12]

The relative molecular mass of nitrogen dioxide is 46.

(i) Calculate the relative molecular mass of carbon monoxide.

............................................................................................................................................. [1]

(ii) Complete the following sentences.

92g of nitrogen dioxide reacts with ...............g of carbon monoxide and produces ...............g of nitrogen.

0.46g of nitrogen dioxide reacts with ...............g of carbon monoxide. [3]

[Total: 6]
4 Use words or phrases from the list to complete the sentences about hormones.

Each word or phrase may be used once, more than once, or not at all.

- gland
- kidney
- liver
- main
- muscle
- plasma
- red blood cells
- target

A hormone is a chemical produced by a ............................................... .

It is transported around the body by the ............................................... .

The part of the body responding to the hormone is called the ................................. organ.

Hormones are destroyed by the ............................................... .

[4]
A student invents a machine to measure the force of the wind.

A large piece of light-weight material is used as a wind-catcher and is attached to the top of a mast.

A newton-meter is used to measure the turning force and is attached to the bottom of the mast.

The mast is free to rotate about a pivot as shown in Fig. 5.1.

Fig. 5.1 (not to scale)

**(a)** The newton-meter is attached 0.25 m from the pivot.

On a windy day the reading on the newton-meter is 52.0 N when the mast is vertical.

(i) Calculate the moment of the force applied by the newton-meter about the pivot.

State the unit.

\[
\text{moment} = \text{.................................. unit ..............} \quad [2]
\]

(ii) The wind-catcher is attached 5.0 m from the pivot.

Calculate the force from the wind when the mast is vertical.

\[
\text{force} = \text{...................................................... N} \quad [1]
\]

**(b)** The newton-meter contains a spring which deforms with elastic deformation.

Describe what happens to the spring in the newton-meter as the force acting on it increases from 0 N and then decreases back to 0 N.

...................................................................................................................................................

............................................................................................................................................. [2]

[Total: 5]
6 Equal volumes of dilute nitric acid are placed into three separate test-tubes. Small pieces of three metals A, B and C are placed in the test-tubes.

The results are shown in Fig. 6.1.

(a) State the test and the result of the test that shows hydrogen is produced when a metal reacts with dilute nitric acid.

test ..................................................................................................................................................
result .................................................................................................................................................
.................................................................................................................................................. [2]

(b) Determine the order of reactivity of the metals A, B and C.

most reactive ..............................

........................................................................
least reactive .............................. [2]

(c) Nitric acid reacts with copper(II) carbonate to produce copper(II) nitrate, water and carbon dioxide.

(i) Complete and balance the equation for the reaction.

\[ \text{CuCO}_3 + \text{HNO}_3 \rightarrow \text{Cu(NO}_3)_2 + \text{H}_2\text{O} + \text{CO}_2 \] [1]

(ii) State the names of two other substances that react with dilute nitric acid to produce copper(II) nitrate.

1 ..........................................................................................................................

2 ..........................................................................................................................

[2]

[Total: 7]
Fig. 7.1 shows how the breathing rates of two students A and B change during and after exercise. Both students are the same age, sex and body mass. They are both resting before the exercise. They both do the same vigorous exercise **for one minute.**

![Graph of breathing rates](image)

**Key**
- `---` student A
- `-` student B

**Fig. 7.1**

(a) (i) Use the information in Fig. 7.1 to calculate the increase in breathing rate for student A as a result of the one minute of exercise.

............................. breaths per min [1]

(ii) Explain why breathing rate increases during exercise.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
........................................................................................................................................... [2]
(b) (i) Describe **two** differences shown in the graph in Fig. 7.1 between the changes to the breathing rates of student A and student B.

1 ................................................................................................................................................

........................................................................................................................................

2 ................................................................................................................................................

........................................................................................................................................

[2]

(ii) Suggest a reason why the breathing rates of student A and student B are different.

................................................................................................................................................

................................................................................................................................................ [1]

(c) Suggest one body function other than breathing rate which increases during exercise.

................................................................................................................................................

................................................................................................................................................ [1]

[Total: 7]
8 A student compares the thermal properties of materials A, B and C.

The apparatus he uses is shown in Fig. 8.1.

![Apparatus Diagram](image)

**Fig. 8.1**

(a) Describe an experiment using the apparatus in Fig. 8.1, that shows material C is the best thermal conductor.

...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
................................................................................................................................................... [3]

(b) The student performs another experiment using different thicknesses of material A.

The results of this experiment show that the thickness of the material is *inversely proportional* to the rate at which thermal energy transfers through it.

On Fig. 8.2 label the *y-axis* and draw a line graph to show this *inversely proportional* relationship.

11 Pentane is a member of a homologous series.

(a) Explain what is meant by the term homologous series.

...................................................................................................................................................
...................................................................................................................................................
.............................................................................................................................................. [2]

(b) When pentane is heated in the presence of a catalyst, the pentane breaks down to form ethene $\text{C}_2\text{H}_4$ and one other product.

(i) Complete the equation for the breakdown of pentane.

\[
\text{C}_5\text{H}_{12} \rightarrow \text{C}_2\text{H}_4 + \text{ ..........} \quad [1]
\]

(ii) State the name of this process.

............................................................................................................................................... [1]

(c) State the test and the result of the test that shows ethene is an unsaturated hydrocarbon.

test ............................................................................................................................................
result ...........................................................................................................................................
................................................................................................................................................... [2]

[Total: 6]
The apparatus shown in Fig. 12.1 is used to find the speed of sound.

Two microphones are connected to an electronic timer.

The metal block is hit with a hammer to produce a short ‘pulse’ of sound.

Microphone 1 detects the pulse of sound and starts the electronic timer.

Microphone 2 then detects the pulse of sound and stops the timer.

The microphones are 1.0 m apart.

Sound travels at a speed of 340 m/s.

(a) Calculate the time taken for the sound to travel 1.0 m.

Use the equation: \[ \text{speed} = \frac{\text{distance}}{\text{time}} \]

\[ \text{time} = \text{...................................................... s} \ \ \ \ [1] \]

(b) The pulse of sound produced by the hammer hitting the metal block contains waves with different frequencies and wavelengths.

(i) One of these waves has a frequency of 485 Hz.

Calculate the wavelength of this wave.

\[ \text{wavelength} = \text{..................................................... m} \ \ \ \ [1] \]
(ii) All of the waves within this pulse of sound reach microphone 2 in the same amount of time.

Explain why.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................  [1]

(c) In each microphone there is a coil of wire that is free to move, and a magnet.

Explain how the pulse of sound causes an e.m.f. to be induced in these coils of wire.

...........................................................................................................................................
...........................................................................................................................................
