READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

SECTION A

Answer ALL questions.

SECTION B

Answer ONE question.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.
1 The Sumatran orangutan, *Pongo abelii*, is found only on the island of Sumatra, Indonesia.

Fig. 1.1 shows a Sumatran orangutan.

**FIG. 1.1**

(a) The International Union for Conservation of Nature (IUCN) is the world’s largest global environmental organisation. The IUCN Red List of Threatened Species™ evaluates the conservation status of plant and animal species. The Sumatran orangutan is categorised as critically endangered on the IUCN Red List.
The Sumatran orangutan spends most of its time in trees and is very sensitive to habitat destruction.

Table 1.1 shows the area of natural forest of Sumatra and the numbers of orangutans in 1985 and 2016.

<table>
<thead>
<tr>
<th></th>
<th>1985</th>
<th>2016</th>
</tr>
</thead>
<tbody>
<tr>
<td>area of natural forest</td>
<td>25.3</td>
<td>12.4</td>
</tr>
<tr>
<td>/million hectares</td>
<td></td>
<td></td>
</tr>
<tr>
<td>number of orangutans</td>
<td>25000</td>
<td>7300</td>
</tr>
</tbody>
</table>

(i) With reference to Table 1.1, state the relationship between area of natural forest and number of orangutans.

________________________________________________________________________________________

________________________________________________________________________________________ [1]
(ii) Calculate the mean annual decrease in orangutan numbers between 1985 and 2016.

Show your working.

Give your answer to the nearest whole number.

mean annual decrease = __________________ [2]

(iii) Use your answer from (a)(ii) to estimate the number of years after 2016 that it will take for the Sumatran orangutan to become extinct in the wild, if conservation work is unsuccessful.

______________ years [1]

(b) Suggest TWO reasons for the decrease in numbers of Sumatran orangutans, other than habitat loss.

________________________________________________________________________ [4]
(b) The number of eggs a bird lays in its nest is called the clutch size.

The variation in clutch size was investigated in the zebra finch over several years.

The data are shown in Fig. 2.1.

![Bar chart showing clutch sizes and number of clutches](image)
(i) Describe the pattern shown by the data in Fig. 2.1.

_________________________________________________________________
_________________________________________________________________
_________________________________________________________________
_________________________________________________________________
_________________________________________________________________

(ii) The data in this investigation were collected over 60 years ago.

The same investigation, carried out today, would produce the same pattern of results.

Explain how the selection factors acting on zebra finches would maintain the same pattern of results.

_________________________________________________________________
(c) The Hardy–Weinberg principle is used to calculate allele, genotype and phenotype frequencies in populations.

- A breeder of birds keeps a population of 86 budgerigars in one enclosed area.
- Two distinct phenotypes are present, blue feathers and green feathers.
- Feather colour is controlled by one gene:
  - G is the allele for green feathers
  - g is the allele for blue feathers.
- Only 17 of the budgerigars have blue feathers.

(i) The Hardy–Weinberg equations are shown in Fig. 2.2.

\[
p + q = 1 \\
p^2 + 2pq + q^2 = 1
\]

**FIG. 2.2**

Calculate the number of heterozygous individuals in the population.

Show your working.

number = __________________ [3]
(ii) The Hardy–Weinberg principle cannot be applied to all populations.

State TWO conditions when the Hardy–Weinberg principle CANNOT be applied.

[Total: 15]
(a) The *lac* operon is a section of DNA present in the genome of the bacterium *Escherichia coli*. The structural genes of the operon are only fully expressed when *E. coli* is exposed to high lactose concentrations.

(i) Fig. 3.1 is a diagram showing the *lac* operon and a nearby region of the *E. coli* genome.

![Diagram of the lac operon](image)

**FIG. 3.1**

Name sections 1, 2, 3 and 4 shown in Fig. 3.1.

1. 
2. 
3. 
4. [2]
(ii) Certain enzymes need to be present inside *E. coli* for it to be able to take up and use lactose. When the genes of the *lac* operon are expressed, the enzymes β-galactosidase and lactose permease are produced in large quantities.

Outline the functions of β-galactosidase and lactose permease.

**β-galactosidase**

- [ ]
- [ ]
- [ ]

**lactose permease**

- [ ]
- [ ]
- [ ]

[2]

(b) (i) Gene *I* is located a short distance away from the *lac* operon.

The product of gene *I*, a repressor protein, is a constitutive protein.

State what is meant by the term *constitutive protein*.

- [ ]
- [ ]
- [ ]

[1]
(ii) Explain why the structural genes of the *lac* operon are NOT expressed when lactose is absent.

________________________________________________________________________________________________________________________________________

________________________________________________________________________________________________________________________________________

________________________________________________________________________________________________________________________________________

________________________________________________________________________________________________________________________________________

________________________________________________________________________________________________________________________________________ ___________________________ [3]

(iii) A strain of *E. coli* has been produced with a mutation in gene *I*. Expression of this gene results in a non-functional repressor protein.

Suggest a negative effect that this mutation will have on this strain of *E. coli.*

________________________________________________________________________________________________________________________________________

________________________________________________________________________________________________________________________________________ ___________________________ [1] [Total: 9]
Domestic goats, *Capra hircus*, show a wide range of coat patterns and colours. One gene involved in coat colour and pattern has multiple alleles. Four of these alleles are:

- A, the allele for white, is dominant to all others
- A\(^b\), the allele for badgerface (stripes on face) and A\(^g\), the allele for grey, are codominant
- a, the allele for black, is recessive to all others.

(a) State ALL the possible genotypes of:

a grey badgerface goat ______________________

a white goat. _______________________________ [2]
(b) A cross between a black goat and a white goat produced a white goat. This white offspring was crossed with a grey goat. The genotype of the grey goat was not known.

Use genetic diagrams to show ALL the possible offspring genotypes and phenotypes that could result from the cross between the white offspring and the grey goat.
(c) When goat skin cells produce black melanin pigment these events occur:

- Melanocyte stimulating hormone (MSH) is secreted into the bloodstream.
- MSH binds to the melanocortin 1 receptor on the cell surface membranes of skin cells.
- This causes a rise in cyclic AMP within the cell.
- The enzyme tyrosinase is activated and begins melanin production.

The white allele A codes for a protein that binds irreversibly to the melanocortin 1 receptor. No rise in cyclic AMP occurs, even when MSH is present in the blood.

Explain the appearance of goats with genotype aa.

[Total: 8]
5 (a) Pigs are farm animals used for livestock in some parts of the world. The first genetically modified (transgenic) pigs were produced in 1985. Foreign DNA was injected directly into the nuclei of zygotes. The foreign DNA was made up of two components:

- the gene coding for human growth hormone
- a section of mouse DNA that, in the presence of metal ions, allows transcription to begin.

(i) The human growth hormone synthesised by the transgenic pigs had the effect of making the pigs grow faster, larger and heavier than non-genetically modified pigs.

Suggest reasons for this difference.

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________

____________________________________________________________________________________ [2]
(ii) Suggest AND explain why the mouse DNA was included in the foreign DNA.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________[3]

Only 1% of the attempts successfully produced transgenic pigs. These pigs showed higher body mass and a greater muscle to fat ratio than normal pigs. Monitoring of the pigs’ behaviour revealed that they rested more than normal pigs, suffered from stomach ulcers and were unwilling to mate.

(b) (i) Discuss whether these transgenic pigs have long term economic value.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________[3]
(ii) Comment on the ethics of producing transgenic pigs showing the features described.
(c) In 2015 pigs were produced that had part of their genome altered by a new technique. The technique involved:

- an RNA sequence designed to bind to a specific targeted pig gene
- a gene-editing enzyme that is able to cut out sections of DNA.

The technique was used on pig zygotes that had been created by IVF. All the zygotes treated grew into piglets and these all showed large deletions in the targeted gene.

This gene coded for a specific cell surface membrane protein. The piglets did not express the protein and this gave them resistance to infection by a virus that causes a serious disease in pigs.

(i) Describe TWO advantages of the gene-editing technique compared to the traditional genetic modification technique used to make transgenic pigs in 1985.

_______________________________________
_______________________________________
_______________________________________
_______________________________________
_______________________________________

[2]
(ii) A scientist stated that this new technique is a form of selective breeding, so is not genetic engineering.

Discuss whether this statement is true AND whether public groups who oppose transgenic animals will be more or less likely to accept the new technique.
